Introduction

Background

Pursuing the commitment of Bluescope Lysaght to constant improvement, this edition of *LYSAGHT Zeds and Cees* reflects the move to limit state design principles.

Since 1987, in conjunction with the University of Sydney, we have intensively researched the behaviour of purlin and girt systems using the vacuum test rig at the University, which is the only one of its type in Australia and the largest in the world. In our NATA-registered laboratory we have tested full-scale purlin and girt systems on single, double and lapped continuous configurations for both inward and outward loading. It has been possible to gain a sound understanding of their behaviour. This knowledge allows us to remain at the forefront of technology, in Australia and overseas.

Since the last edition of this manual, the results of this research has been used in the development of *AS/NZS 4600: 1996 Cold-formed steel structures*. New software has been developed for the design of *LYSAGHT Zed* and *Cee* purlins.

This manual incorporates the whole range of *LYSAGHT* purlins and girts in a much wider range of spanning and bridging configurations than before. There has also been a rationalisation of coating mass.

The data are intended for specifiers, engineers, builders and erectors for the specification, detailing and erection of *LYSAGHT* purlin and girt systems. Included are details of material specifications, dimensions, packing, storage, holes, and bridging location; together with limit state capacity tables.

Lysaght products detailed in this manual

| Product | Use | Code prefix |
|---------------------------|--|-------------|
| LYSAGHT® Zeds | General purpose purlins and girts | Z |
| LYSAGHT® Cees | General purpose purlins and girts | C |
| LYSAGHT® Fascia Purlins | Fascia purlins | FP |
| HOOK-LOK II® Bridging | Flexible bridging system for bracing Zeds & Cees | H2 |
| Series 300 & 350 Bridging | Bridging system for larger spans and greater loads | |
| LYTCURVE® | Curved purlins and girts | |

Product coding

A prefix letter for the section shape, and a number indicating the section depth in millimeters designates profiles. For example Z250, or C250; or, where reference is made to both sections of a given size, Z/C250.

General data for Zed & Cee Sections

LYSAGHT Zed and Cee sections are accurately roll-formed from high-strength zinc-coated steel to provide an efficient, lightweight, economical roofing and cladding support system for framed structures.

The system, which includes HOOK-LOK II bridging, Series 300 and 350 bridging, and a comprehensive range of accessories, is supplied ready for erection.

Applications

LYSAGHT Zed sections may be used over single spans, unlapped continuous, and lapped continuous spans in multi-bay buildings. Lapped continuous spans result in a considerable capacity increase in the system.

LYSAGHT Cee sections may be used in single spans and unlapped continuous spans in multi-bay buildings. Cee sections are ideal as eave purlins or where compact sections are required for detailing. Cee sections cannot be lapped.

Range of products & services

Our wide range includes:

- A full range of LYSAGHT Zeds and Cees;
- A full range of LYSAGHT Zeds and Cees with downturned-lip;
- Section sizes from 100 mm to 350 mm;
- LYTCURVE® Cee purlins from 100 mm to 250 mm;
- Technical information for cleatless connections (see Design notes for capacity tables);
- HOOK-LOK® II bridging systems;
- Bolting systems to suit project needs;
- The Bluescope Lysaght corrosion warranty;
- Advice on improving the life expectancy of purlin systems in corrosive environments;
- Access to a national network of experienced engineers.

Performance

In accordance with the provisions of AS/ANZ 4600:1996 *Cold-formed steel structures*, load capacities have been calculated for LYSAGHT sections using approved LYSAGHT bridging systems, bolting and other accessories. Sections chosen using the data provided in the tables will perform as specified when the design, fabrication and erection are carried out in accordance with Bluescope Lysaght recommendations and accepted building practice.

Non-standard sections

We can supply a wide range of non-standard sizes (up to 350 mm) and shapes, including Cees and Zeds with downturned lip—the Zeds can also be made to lap. Non-standard sections are not stocked in every region.

Corrosion warranty

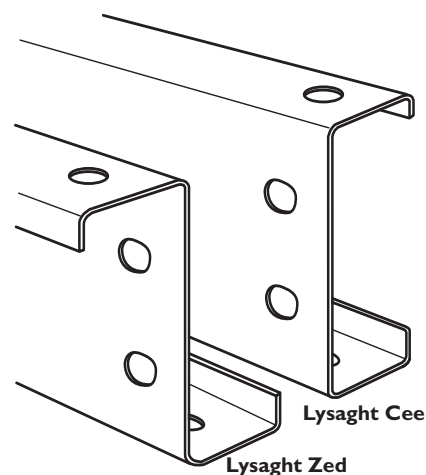

Lysaght purlins and girts are manufactured from GALVASPAN® steel. Subject to design, location and intended use, they are covered by the Bluescope Lysaght corrosion warranty.

Corrosion protection & material compatibility

Some building materials and environmental conditions can be detrimental to coated steel products. These include contact with or exposure to runoff from:

- industrial, agricultural, marine or other aggressive atmospheric conditions;
- incompatible metals, like lead or copper;
- building materials subject to cycles of dryness and wetness, or which have excessive moisture content such as improperly seasoned timber.
- materials which have been treated with preservatives, like CCA or tanalith-treated timber.

A zinc coating of Z350 (350 g/m² minimum coating mass) is the standard coating class provided with LYSAGHT Zed and Cee sections. This will provide a long and trouble-free life for enclosed buildings and open-sided rural buildings, in a non-aggressive environment.

Standard range of Lysaght Zeds and Cees

| Nominal section size (mm) | BMT (mm) |
|---------------------------|--------------------|
| 100 | 1.0, 1.2, 1.5, 1.9 |
| 150 | 1.2, 1.5, 1.9, 2.4 |
| 200 | 1.5, 1.9, 2.4 |
| 250 | 1.9, 2.4 |
| 300 | 2.4, 3.0 |
| 350 | 3.0 |

A non-aggressive environment is 1000 m from rough surf, 750 m from industrial emission and fossil fuel combustion, and 300 m from calm salt waters. Consideration must be given to the nature of activities performed within the building.

For more severe corrosive environments a Z450 (450 g/m² minimum coating mass) will be required. This heavier coating mass will be available in special circumstances and is subject to a minimum order quantity and extended lead times.

Direct contact of incompatible materials with the coating must be avoided. In such applications, and in very corrosive environments, suitable paint systems can be obtained from paint manufacturers: you can seek advice from our Information Line.

In applications where particular attention is required for corrosion, or the buildup of substances like dust or grain, then consideration should be given to the shape of the sections (either Zed, or Cee, or Zed with downturned lip); orientation of the sections; and coating class. Further information is available from your nearest Bluescope Lysaght Service Centre.

Available lengths

LYSAGHT purlins are available custom-cut in any transportable length, however there are some limitations.

For minimum lengths, and lengths over 12000 mm, contact your nearest Bluescope Lysaght office.

For normal deliveries nominal lengths should not exceed 12000 mm. Lengths greater than 12000 mm require special transportation and on-site handling facilities. Law restricts the hours of transportation and permits may be required in some states. Lengths greater than 19500 mm require a special transportation permit.

The maximum length of the Fascia Purlin FP23019 is 15000 mm.

Length tolerance for all sections is ±5 mm.

Packing

LYSAGHT Zed and Cee sections are delivered in strapped bundles. The actual quantity in each bundle will vary with section size, order and length. The bundle mass is generally approximately one tonne.

Bluescope Lysaght accessories are delivered in strapped or wired bundles, bags, or packages as appropriate.

Storage on-site

If not required for immediate use, sections should be neatly stacked off the ground and on a slight slope so that water can drain away. Sections and accessories should not be left exposed in the open for extended periods.

Ordering

To make ordering of the full purlin and girt system easier, every Bluescope Lysaght Sales Office has order pads available on request.

Material specifications

LYSAGHT Zed and Cee sections are roll-formed from GALVSPAN® steel complying with AS1397—1993. In the grades shown, the number prefixed with G indicates minimum yield stress in MPa; and the number prefixed with Z indicates minimum coating mass in g/m².

- 1.0 mm BMT: G550, Z350*
- 1.2 mm BMT: G500, Z350*
- 1.5, 1.9, 2.4 and 3.0 mm BMT: G450, Z350*

* All BMTs in Townsville have Z450 coating.

Further information is available from www.lysaght.com, our Steel Direct Information Service on **1800 641 417** or the local Bluescope Lysaght Service Centre.

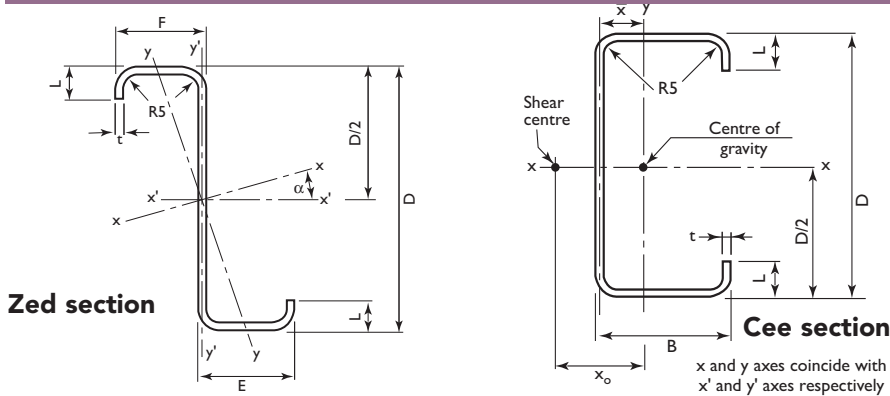

Bolt specification

LYSAGHT purlin bolts and nuts have integral washers.

Tighten all bolts to 55 Nm torque.

| Nominal section size (mm) | Bolt specification |
|-----------------------------|---|
| 100, 150, 200, 250, FP23019 | M12 LYSAGHT purlin bolt: standard (grade 4.6) or high strength (grade 8.8) |
| 300, 350 | M16 LYSAGHT purlin bolt: standard (grade 4.6) or high strength (grade 8.8) |

Zed & Cee Sections Dimensions and properties

LYSAGHT Zed sections

LYSAGHT Zed sections feature one broad and one narrow flange, sized so that two sections of the same size fit together snugly, making them suitable for lapping.

Continuous lengths of purlin result in better economy, but lapping provides two thicknesses of metal over interior supports. Lapping increases the strength of the sections where bending moments and shear are at a maximum, thus improving the load capacity and rigidity of the system.

LYSAGHT Zed sections of the same depth and different thicknesses can be lapped in any combination.

LYSAGHT Zed sections may also be used over simple spans. For shorter spans they may be used continuously over two or more spans without laps—thus producing reduced deflection compared with simple spans—but it does not give the strength of a fully lapped system.

LYSAGHT Zed sections with one lip turned outward (called *downturned lip purlins*) may be used in simple or continuous spans with the ends butted.

Typical assemblies are shown later in this manual.

LYSAGHT Cee sections

LYSAGHT Cee sections have equal flanges and are suitable for simply supported spans. For shorter spans they may be used continuously over two or more spans with the ends butted, thus producing reduced deflection compared with simple spans. They cannot be lapped.

Typical assemblies are shown later in this manual.

Dimensions of Zeds & Cees

| Catalogue number | t mm | D mm | Mass per unit length kg/m | Zeds | | | Cees | |
|------------------|------|------|---------------------------|------|------|------|------|------|
| | | | | E mm | F mm | L mm | B mm | L mm |

Properties have been computed on the basis of mean flange width. The introduced error is negligible.
The shear centre and monosymmetry constant deviations can be disregarded, that is, taken as zero.

LYSAGHT fascia purlin FP23019

The LYSAGHT Fascia Purlin FP23019 meets the need of buildings with bigger portal frame spacings for long-length, one-piece fascia purlins.

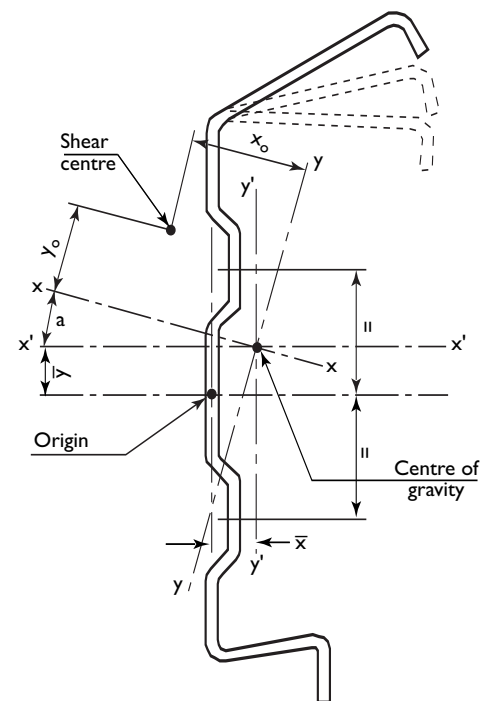

A number of features make Lysaght Fascia Purlins attractive and economical as a combined eave purlin and fascia:

- It can be supplied without splice plates.
- The fluted web strengthens the section and provides a flush external face with standard Lysaght purlin bolts recessed in the flutes. There are no special fascia bolts.
- The top flange can be rolled at angles from 84° to 120° for roof pitches from 6° to 30°.
- The bottom flange is shaped to provide simple fixing for wall sheeting.

Notes to load capacities table

1. Load capacities have been calculated on the basis of the top flange being at 90° to web.
2. Load capacities for one- and two-bridging cases assume roof sheeting attached to top flange.
3. Load capacities for fully bridged case assume roof sheeting attached to top flange and wall sheeting attached to bottom lip.
4. For detailing, note that mounting face is 12 mm behind front face.
5. Standard LYSAGHT M12, grade 4.6, purlin bolts to be used.
6. The tables assume the use of a LYSAGHT bridging system and LYSAGHT bolts.

LYSAGHT LYTCURVE purlins

are curved in the web.

LYSAGHT LYTCURVE purlins are Bluescope Lysaght's exclusive answer to the need for curved purlins or girts. They are formed from LYSAGHT Cees, curved in the plane of the web.

Because the dimensions of Cees may change during curving, the section properties and capacity tables in this book don't apply to LYTCURVE purlins. You need detailed engineering assessment where you want to use LYTCURVE purlins as a structural member.

Availability

Designs using LYTCURVE purlins may be restricted by the length of the Cee section from which the purlin is formed, and by transportation of big radius items. In some cases, two or more LYTCURVE purlins may be needed.

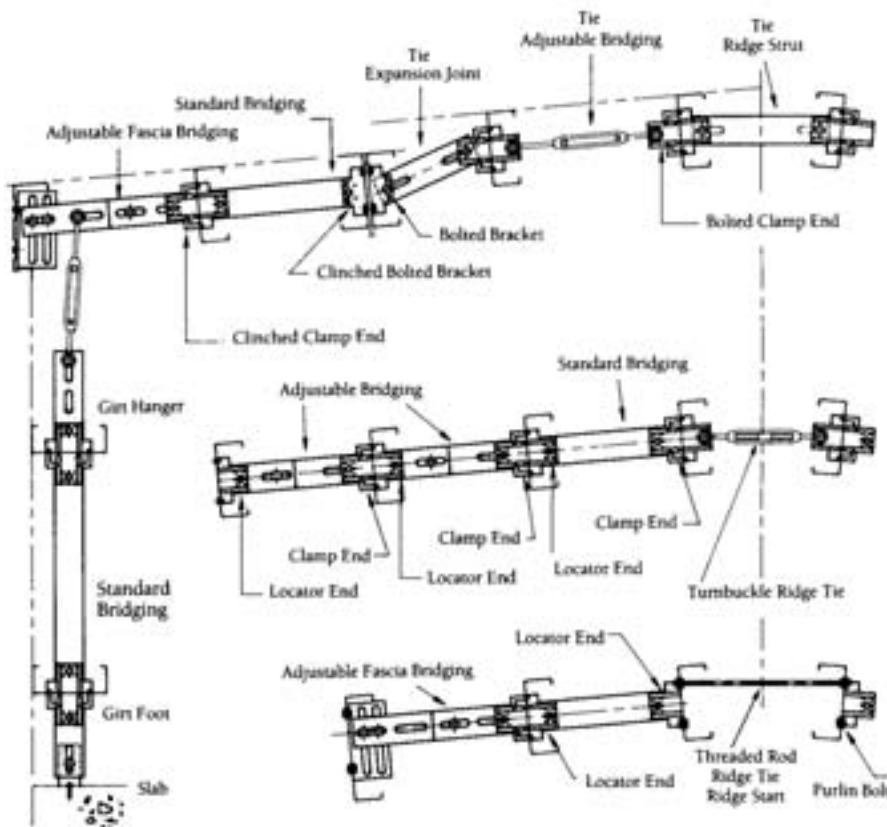

Product range

The following range can be manufactured.

| Catalogue number | Minimum bend radius (m) |
|------------------|-------------------------|
| CI0019 | 4.5 |
| CI5024 | 8 |
| C20024 | 30 |
| C25024 | 70 |

HOOK-LOK II bridging system

Hook-lok II bridging configurations

The LYSAGHT HOOK-LOK II bridging system is the most adaptable and flexible bridging system available, to securely brace both Zed and Cee purlins and girts of depths 100, 150, 200 and 250 mm. It is also fast and easy to install and can accommodate most construction configurations.

The system consists of solid bridging assemblies between purlins and girts, and adjustable bridging assemblies at locations such as eaves, ridge and girt foot.

Purlins and girts display two types of lateral instability: lateral deflection and twist (rotation or roll). It is necessary to control these instabilities by providing suitable bracing as close as possible to the flanges of the section.

Bracing can be continuous (such as rigid cladding suitably fastened to the flange), or point bracing at the midspan region (or at a point of maximum bending), or several points at the midspan region.

In practice, Bluescope Lysaght claddings with screw fasteners are a suitable lateral bracing when attached to the flange. However, as with all thin-walled claddings, the twisting resistance is difficult to quantify. Consequently, point bracing is still required to resist twist of the section and lateral deflection of the free flange. Point bracing is also required to stabilise and straighten the purlins and girts prior to fixing of the cladding in order to facilitate the fixing operations.

Point bracing types are 'ties' and 'bridging'. Ties can be loaded in tension only. Bridgings are solid members secured to the webs of the purlins and girts. They can be loaded in tension, compression and bending.

For this reason, a continuous run of bridging is the most effective stabiliser for both wall and roof, and is the most widely accepted.

Fascia bridging system

In certain configurations of wall design, the loads imposed on the fascia system by the girt hanger may be large. This demands an increase in the fascia system capacity to prevent excessive twisting.

Components

The basic parts of each HOOK-LOK II bridging assembly are the locators and clamps. They firmly lock each purlin or girt in position when simply located and hooked into the bridging holes from opposite sides of the web.

Locators and clamps have hook centres to match the holes punched in the webs of LYSAGHT Purlins and Girts. The hole punching in the purlins and girts match the holes for cleat supports of the purlin and girts.

HOOK-LOK II components are not sold individually, only as part of a bridging assembly.

The examples show assemblies with the ends of equal size, however the system works well for assemblies with unequal ends.

Bridging assembly

Bridging assemblies are supplied in lengths to suit the nominated purlin or girt spacing. There are some limitations on minimum lengths.

With the flexibility of component combinations it is possible to make many bridging assemblies. The HOOK-LOK overview shows bridging configurations.

Typical bridging assemblies include:

- Standard bridging assembly
- Ridge bridging assembly
- Girt foot/hanger bridging assembly
- Fascia bridging assembly
- Adjustable bridging assembly
- Expansion joint

Product codes

HOOK-LOK II bridging assembly catalogue numbers indicate purlin size (nominal depth). Locators, clamps and other accessories are matched to the purlin size.

How to specify

When specifying HOOK-LOK II bridging assemblies:

1. Specify the HOOK-LOK II prefix H2.
2. Specify left hand end component – always three characters (e.g. C20)
3. Specify the type of bridging channel – always one character (e.g. P)
4. Specify right hand end component – three characters (e.g. L20)

Putting these together, you would get: H2 C20 P L20.

Example 1

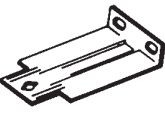

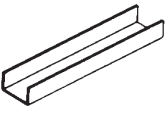

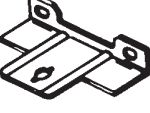

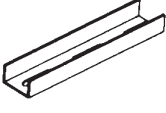

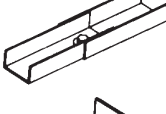

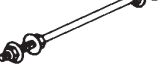

An adjustable bridging, with clamp to suit a C15015 purlin at one end and a bolted bracket to suit a C20024 purlin at the other end would be: H2 C15 T B20.

(This assumes that the order was not for use in Victoria where the product code would be H2 C1V T B20 – see note to Product codes table.)

Example 2

Fascia bridging, to span between a C20024 used as a fascia purlin and C20015 purlin, would be: H2 F20 D L20.

Product codes for Hook-Lok II parts

| | Mark No. | | Mark No. | | Mark No. |
|------------------------------|---|------------------------------|---|---|---|
| Clamp end CODE C |  C10 C15 C1V* C20 C25 | Bolted brackets CODE B |  B10 B15 | Bridging channel: plain CODE P |  P |
| Locator end CODE L |  L10 L15 L1V* L20 L25 | |  B20 B25 | Bridging channel: slotted CODE S |  S |
| Fascia brackets CODE F |  F20 F25 | Turnbuckle CODE T |  T10† T12† | Bridging channel: double CODE D |  D |
| | | Tie rod CODE R |  R12† R16† | Girt bracket CODE G |  G |

* For Victoria, 150 size bridging is specified using a 'V' instead of the 'S'

† 10, 12 or 16 refer to rod diameter in mm

HOOK-LOK II installation

Purlin bridging

HOOK-LOK II bridging into Zed or Cee purlins may be installed in numerous ways. The normal procedure is to commence from the eave or ridge. A typical installation procedure is:

- Step 1:** Install the fascia bridging assembly by inserting the locator end into the holes of the first purlin, and bolting the fascia bracket to the fascia purlin.
- Step 2:** Install the standard bridging assemblies working towards, and finishing at, the ridge purlin. Standard assemblies are installed by fitting the clamp end over the previously-installed locator end and swinging the bridging around until the locator end engages in the holes of the next purlin.
- Step 3:** Where applicable, repeat Steps 1 and 2 for the opposite side of the roof. If appearance is a consideration, the bridging runs on both sides of the roof should be swung into position from the same end of the roof.
- Step 4:** Install the ridge bridging assembly by fitting the clamp ends over the previously installed locator ends and then tightening the bolts of the ridge assembly.
When a ridge bridging assembly is not used, the locator(s) of the standard bridging is secured into position with two bolts.
- Step 5:** Where turnbuckles are used in a bridging assembly, first align the purlins. Align the fascia purlin using the, adjustment bolts of the fascia bridging assembly.

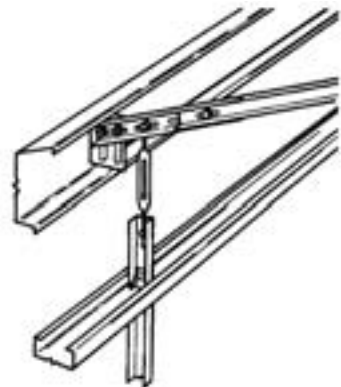

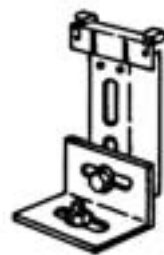

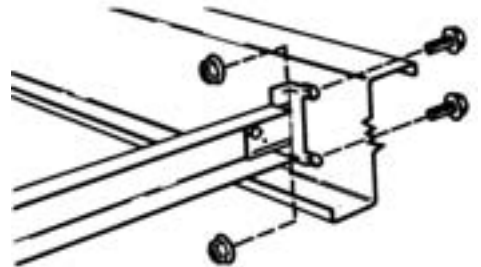

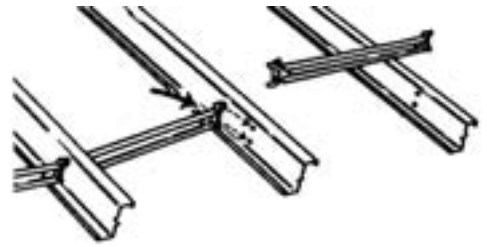

Girt bridging

The recommended procedure is to commence at floor level and work towards the eaves. A typical installation procedure is:

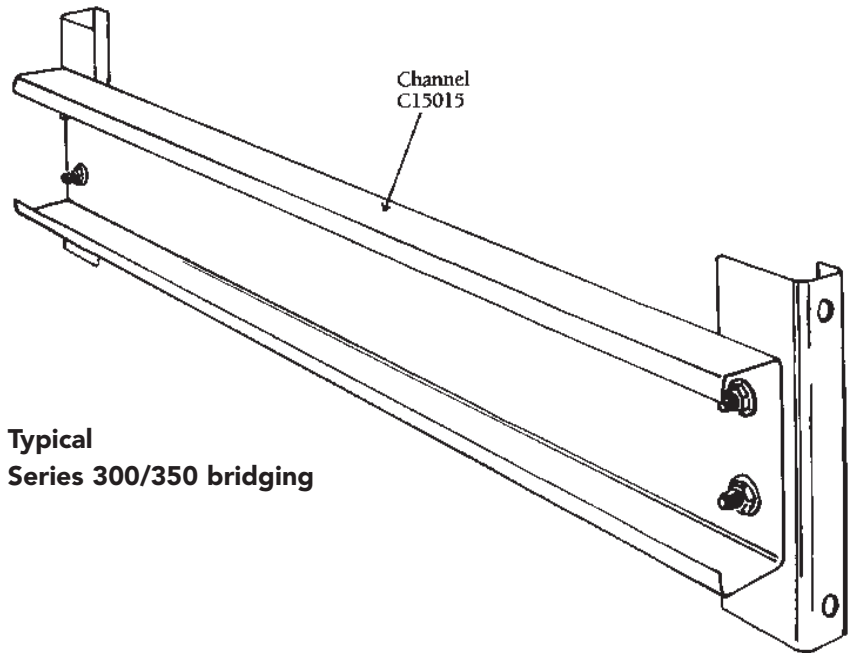

- Step 1:** Install the girt foot assembly by engaging the locator into the holes of the bottom girt. Due to the loads transferred to the bridging from the girts, the girt foot assembly must be anchored to the slab.
- Step 2:** Adjust the girt foot assembly to level off the bottom girt. Where the slab is not yet poured, a temporary support is required to keep the bottom girt level.
- Step 3:** Install standard bridging assemblies as described in Step 2 for purlin bridging, working towards the eaves.
- Step 4:** At the top girt, the locator is secured into position with two bolts. If appearance is a consideration ensure the girt and purlin bridging are installed facing the same direction.
Where a girt hanger is used it is installed by fitting the clamp end over the last installed locator end and swinging the bridging around, then bolting the turnbuckle to the fascia bridging.

In projects where no girt foot assembly is used, particular care in design and construction is required. We recommend the following precautions during construction:

1. The roof sheeting should be installed before the turnbuckle of the girt hanger is used to level the girts, which would impose loads on the fascia system; and
2. Provide a temporary girt support under the bottom girt until the installation of the wall cladding is complete for that section.

LYSAGHT Series 300 & 350 bridging system

**Typical
Series 300/350 bridging**

For the larger sections, 300 and 350 series (LYSAGHT Big Zeds and Big Cees), a more substantial bridging system is required, due to larger spans and greater loads.

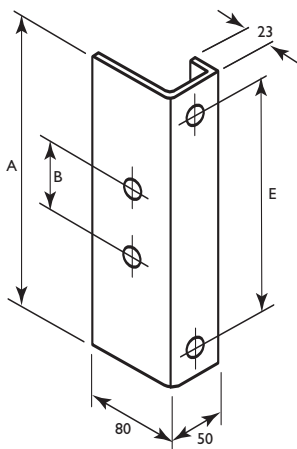

The bridging components are bigger and have additional lip stiffening.

The components consist of a C 15015 channel and bridging ends assembled with LYSAGHT high strength M12 x 30 mm purlin bolts.

All components are galvanised for long life and can be assembled using the recommended bolts or by welding.

When ordering, the overall bridging length should be specified, i.e. purlin or girt spacing, less 3 mm. Catalogue numbers for the bridging are:

- BZ300 or BZ350.

Bridging end

Bridging end dimensions

| Depth of purlin (mm) | Catalogue No. | Dimensions (mm) | | |
|----------------------|---------------|-----------------|----|-----|
| | | A | B | E |
| 300 | 300 EB | 260 | 60 | 210 |
| 350 | 350 EB | 310 | 60 | 260 |
| 300 Victoria only | 300 EBV | 260 | 70 | 210 |
| 350 Victoria only | 350 EBV | 310 | 70 | 260 |

Purlin and girt accessories

Manufactured from zinc-coated steel, accessories are an integral part of LYSAGHT purlin and girt systems.

Purlin bolts

M12 size

PB1230 LYSAGHT standard purlin bolt (grade 4.6): M12 x 30 mm with nut.

PB1230HS LYSAGHT high-strength purlin bolt (grade 8.8): M12 x 30 mm with nut.

PBS1230 LYSAGHT shouldered purlin bolt (grade 4.6) with 16 mm shoulder: M12 x 30 mm with nut.

M16 size

PB1645 LYSAGHT standard purlin bolt (grade 4.6): M16 x 45 mm with nut.

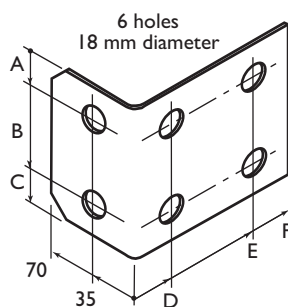

PB1645HS LYSAGHT high-strength purlin bolt (grade 8.8): M16 x 45 mm with nut.

Fascia bolt

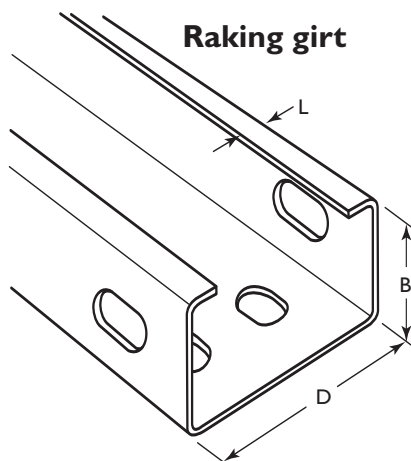

FB1230 LYSAGHT fascia bolt (grade 4.6): M12 x 30 mm with plain hex. nut & two plain washers.

General purpose bracket

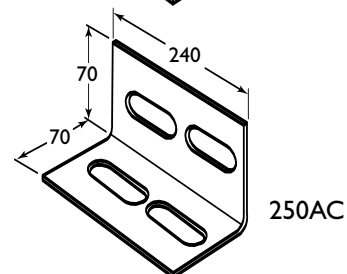

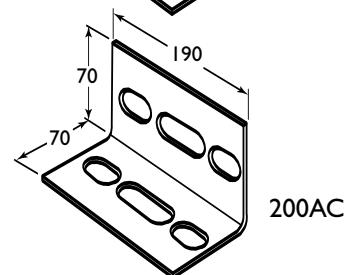

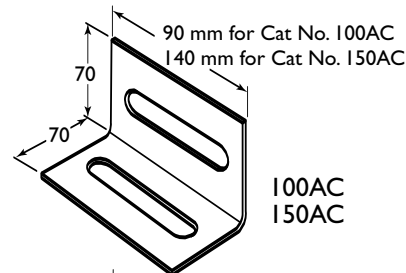

| Cat. No. | A | B | C | D | E | F |

Cleats

For sizes see Page 19

Typical assemblies

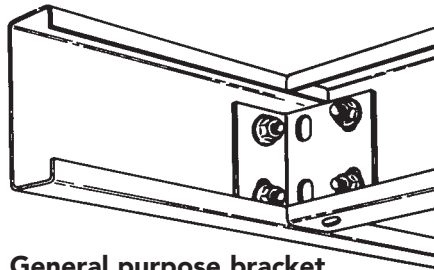

Using purlin & girt accessories

Raking girt assembly

Shown is one method of fitting raking girts using bolts and clamp plates. The raking girt bracket is used to attach the end of a C10015 raking girt to the fascia purlin.

Alternatively the raking girt can be installed open face down. The clamp plates are deleted and the girt attached with bolts fitted through holes prepunched in the web of the purlin.

General purpose bracket

The general purpose bracket is ideal for making joints of approximately 90° and is usually used for joining sections of the same web depth. Typical applications include lightly loaded heads to openings, trimmers and fascias at gable ends.

Figure (a)

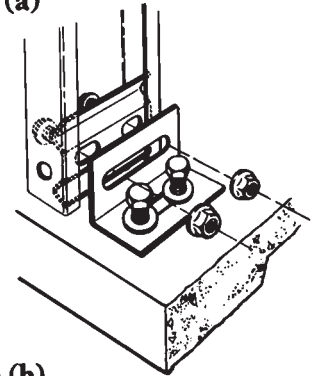

Figure (b)

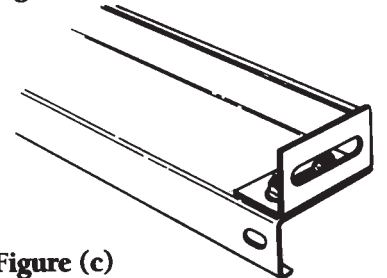

Figure (c)

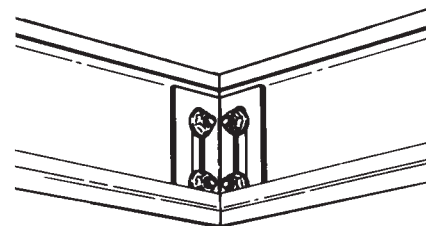

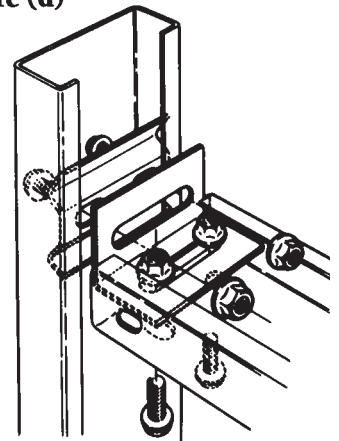

Figure (d)

Angle connector

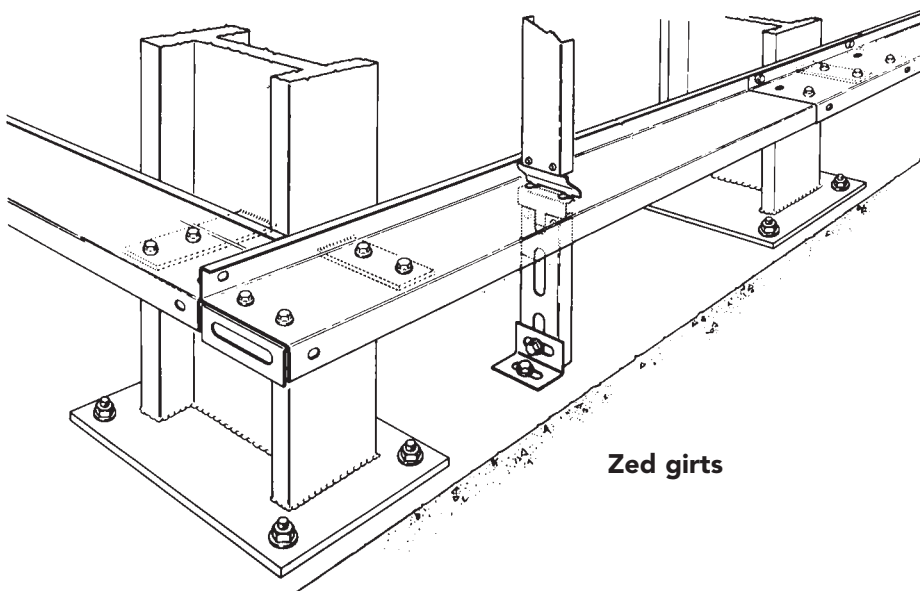

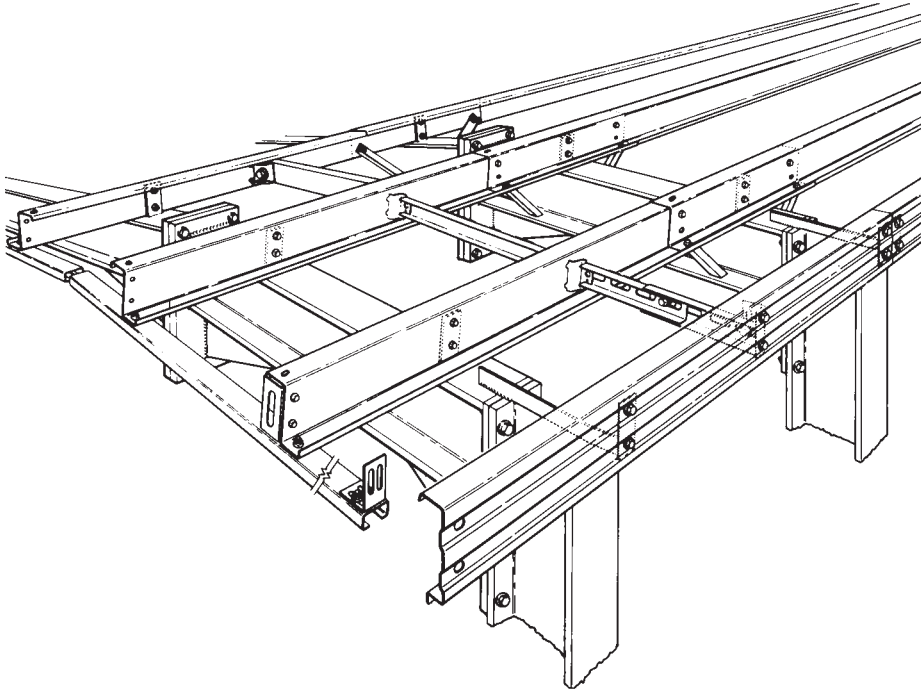

The Angle Connector can be used in a variety of different ways. The holes allow connection between sections of the same size or one size smaller. Figure (a) shows the angle connector and clamp plate as a foot mounting for lightly loaded vertical members such as jambs for personnel access doors or windows. It can also be used as a column base in lightly loaded or internal applications. Figure (b) shows a closed end on a girt. This obviates the need for mitred girts at corners while still providing a satisfactory attachment point for the cladding and corner treatment. Figure (c) shows a simple mitred 90° joint. Figure (d) shows the angle connector and clamp plate used as an attachment for trimmers or non-load-bearing heads to openings.

Typical assemblies - Zeds

Typical assembly using LYSAGHT Zed sections and HOOK-LOK II bridging.

Where fly bracing is used in conjunction with lapped Zed sections it is important that the bolt requirements for lapping are not compromised.

Zed purlins

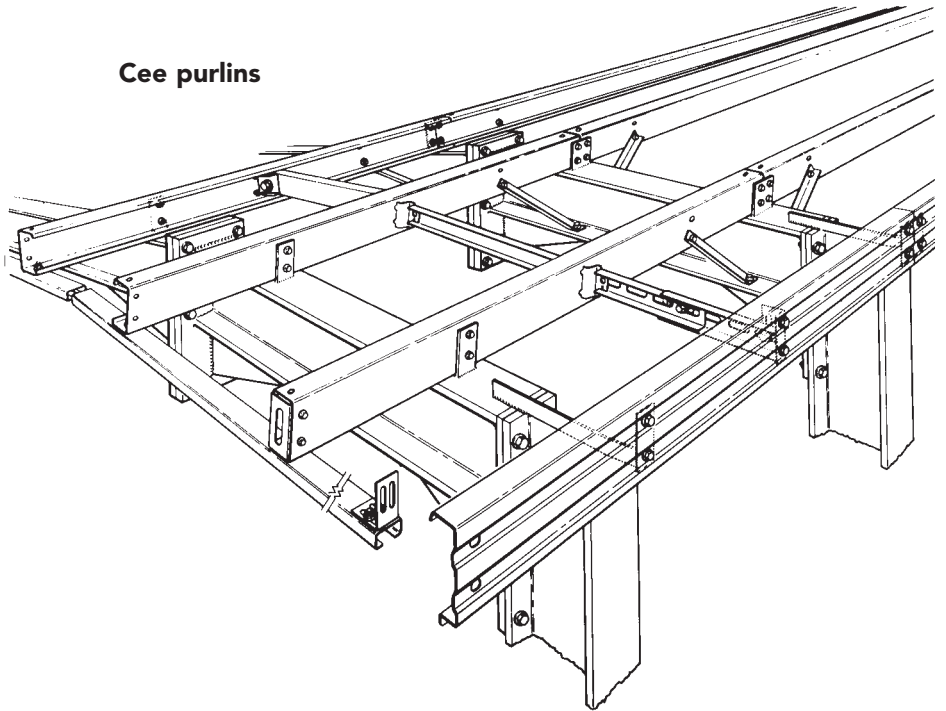

Zed girts

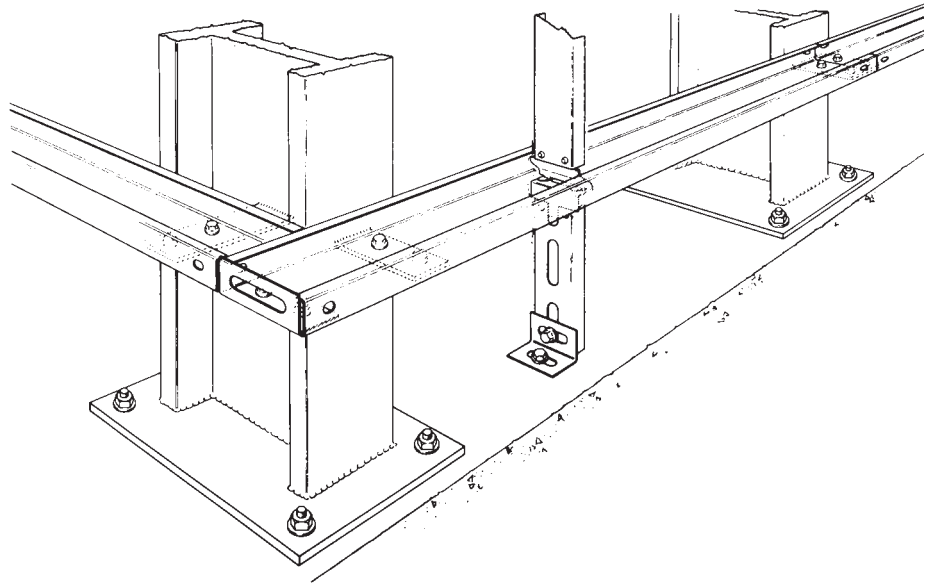

Typical assemblies - Cees

Typical assembly using LYSAGHT Cee sections and HOOK-LOK II bridging.

Cee purlins

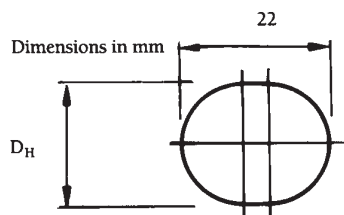

Cee girts

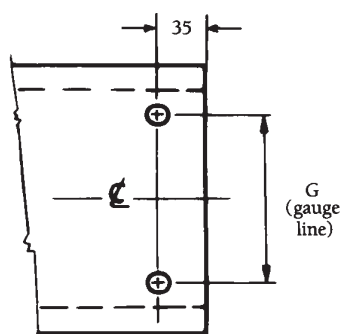

Holes & Cleats

LYSAGHT Zed and Cee sections are normally supplied with holes punched to the Australian Institute of Steel Construction (AISC) gauge lines, except, in Victoria where the 150 series sections are punched to the Structural Steel Fabricators Association, Victoria, recommended gauge lines.

Hole details and gauge lines for LYSAGHT Zed and Cee sections

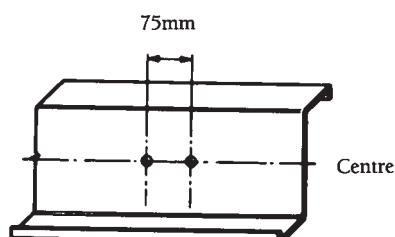

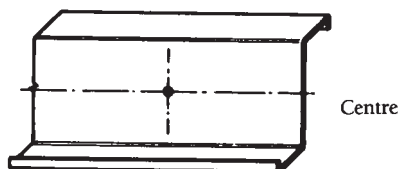

BHP Building Products standard elongated punched hole. Holes equally spaced above and below centre line

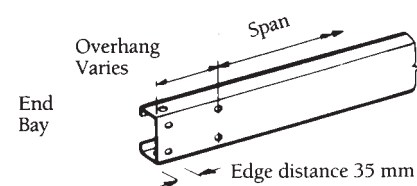

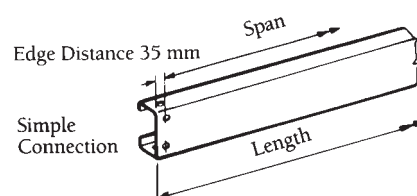

| Nominal section size (mm) | G (mm) | D _H |
|---------------------------|--------|----------------|
| 100 | 40 | 18 |
| 150 - Victoria only | 70 | 18 |
| 150 - Other states | 60 | 18 |
| 200 | 110 | 18 |
| 250 | 160 | 18 |
| 300 | 210 | 22 |
| 350 | 260 | 22 |

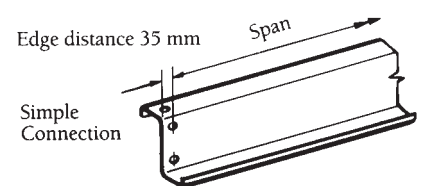

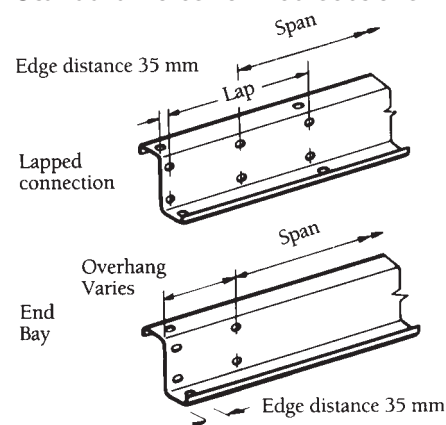

Centreline holes for 300 and 350 sections only

Standard holes for Cee sections

Standard holes for Zed sections

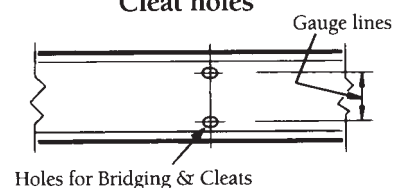

The holes are required at cleat supports at ends of laps and at bridging points. For the webs of 300 and 350 sections (*Big Zeds* and *Big Cees*), centreline holes are also available on request, and may be combined with cleat holes to provide 3-bolt fastening to the cleats.

For the 100, 150, 200 and 250 deep sections the holes are elongated with dimensions of 18 mm x 22 mm suitable for M12 bolts. For the 300 and 350 deep sections the holes are 22 mm diameter suitable for M16 bolts. Sections are also available unpunched if required.

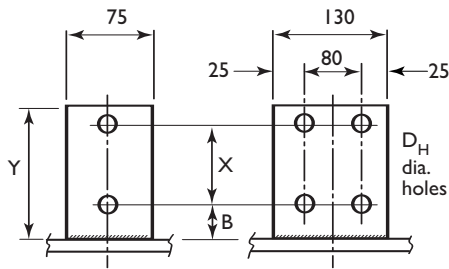

For special projects the size of the hole, the number of holes, and the gauge lines may be modified by negotiation. These projects will be subject to minimum order quantities and extended lead times.

Bridging holes and Cleat holes

Holes for Bridging & Cleats

Hole details of cleats

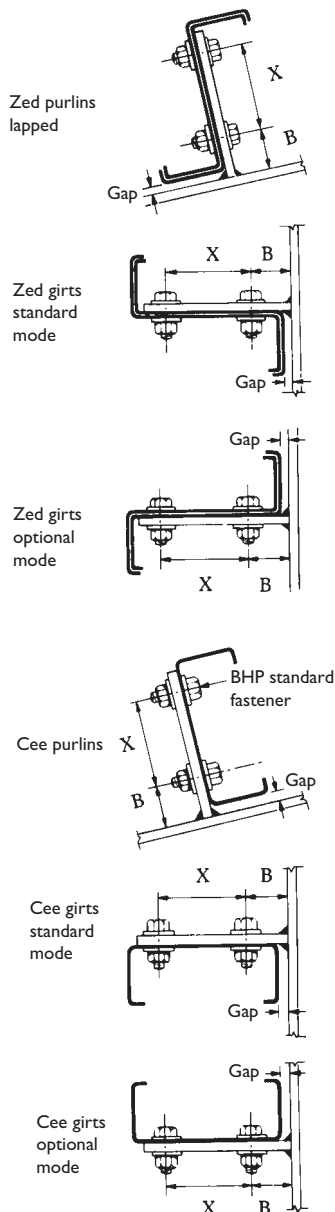

Cleat nominal dimensions (mm)

| Nom.section size (mm) | X | B | Y | t (thickness) | Gap | D _H |
|-----------------------|-----|----|-----|---------------|-----|----------------|
| 100 | 40 | 40 | 105 | 8 | 10 | 18 |
| 150 Vic only | 70 | 50 | 145 | 8 | 10 | 18 |
| 150 Other states | 60 | 55 | 145 | 8 | 10 | 18 |
| 200 | 110 | 55 | 195 | 8 | 10 | 18 |
| 250 | 160 | 55 | 245 | 8 | 10 | 18 |
| 300 | 210 | 65 | 305 | 12 | 20 | 22 |
| 350 | 260 | 65 | 355 | 12 | 20 | 22 |

When using Zed sections with downturned lips, longer cleats are required to give clearance from the main supports.

Fastening to cleats

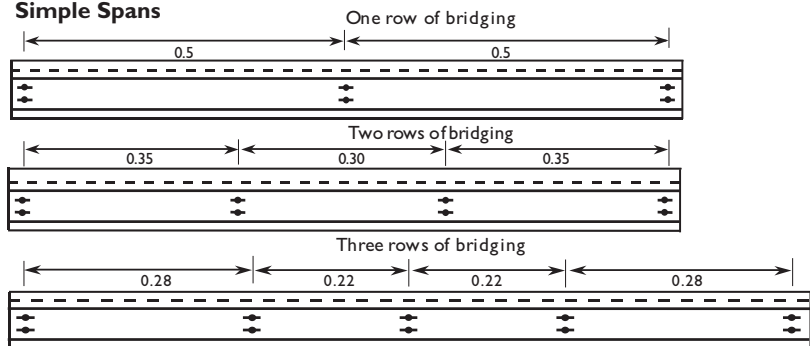

NOTE

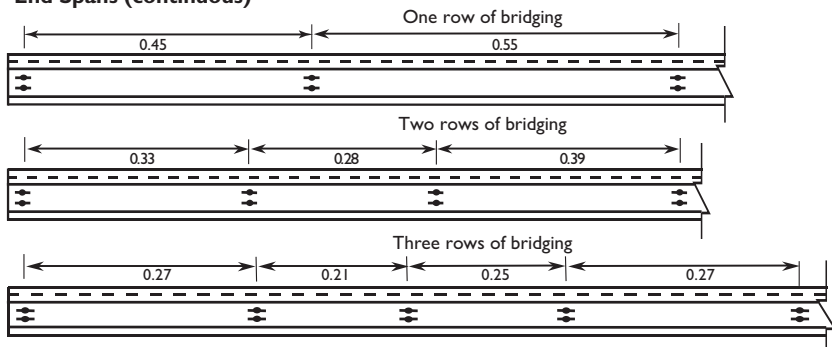

To minimise the tendency of Zeds and Cees to rotate when used as purlins, it is necessary to have the top flange pointing up the slope. Purlin orientation may be a consideration in certain projects.

Location of bridging holes

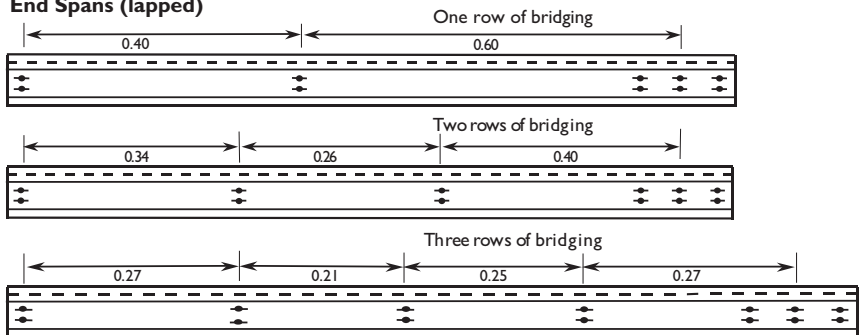

Simple Spans

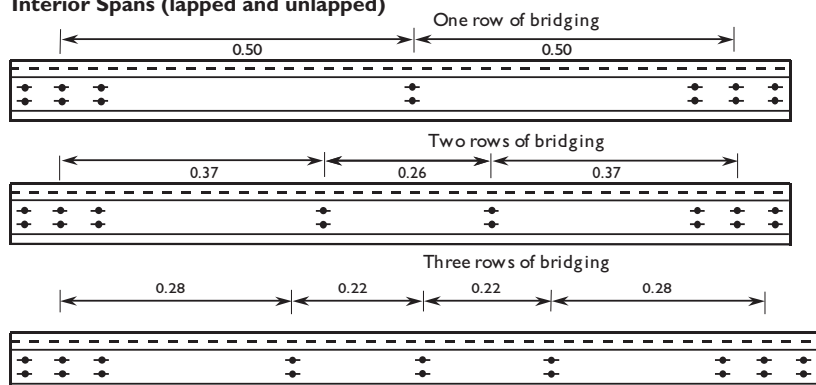

End Spans (continuous)

End Spans (lapped)

Interior Spans (lapped and unlapped)

Design notes for capacity tables

When determining a design, consideration should be given to load combinations for both strength and for serviceability.

Design philosophy

The limit state capacity tables have been compiled using a finite element flexural torsional buckling analysis for modeling the whole purlin system.

The model considers both in-plane distribution of axial force, shear force and bending moments, as well as out of plane buckling modes.

The finite element flexural torsional buckling analysis assumes that:

- all purlins bend about the axis which is perpendicular to the web;
- there is continuity at the laps;
- there is minor axis translation and twisting restraint at the bridging points;
- there is lateral stability in the plane of the roof at internal supports and the ends of cantilevers; and
- both screw-fastened and concealed-fixed claddings provide restraint.

All design calculations for both strength and serviceability are in accordance with AS/NZS 4600:1996 Cold formed steel structures and AS/NZS Supplement 1:1998 Cold-formed steel structures—Commentary.

Deflection

There are no specific rules governing acceptable deflections, though structural codes give guidance. You need to consider the specific requirements of any structure. It may be necessary to design for deflection under more than one load combination. See also *Assumptions used in tables*.

Axial loads

Where a section is not loaded to its full capacity in bending, it has a reserve of strength to carry some axial load. This reserve in purlins and girts can be used to transmit forces due to wind loading on end walls, or to resist forces due to bracing of wall and roof structures.

Where required, the combined bending and axial load capacity should be calculated using AS/NZS 4600:1996 *Cold-formed steel structures*. Advice is available from our information line.

Point loads

The values in this publication assume uniformly distributed loading. However, in many applications (like the mounting of services and maintenance equipment) the loads applied to a structure are point loads. Thus, to use these tables for point loadings, the loads must be converted to equivalent distributed loads.

The table on the following page gives conversion formulae for loads on simple spans and lapped spans. They have been derived from commonly published moment and shear data, and give conservative conversions.

For simple spans the formulae are straight forward. For non-continuous lapped spans the formulae depend on the number of spans, the position of the span and the lapping ratio; thus the worst-case configuration has been used, and the values may be safely used for end spans, interior spans and any lapping ratio greater than 10%.

Formulae for loads on continuous unlapped configurations, and for deflections in all configurations, are not given but may be derived similarly.

Symbols used in table for conversion of point loads

P = single point load (kN)

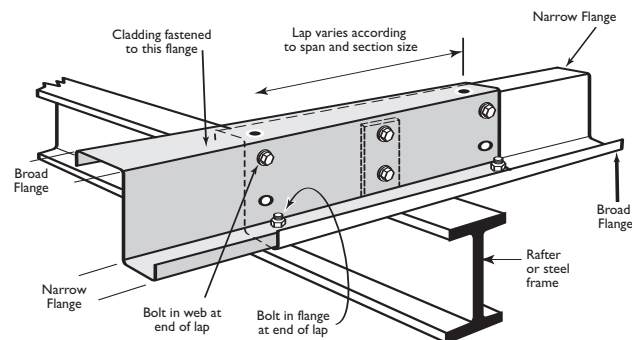

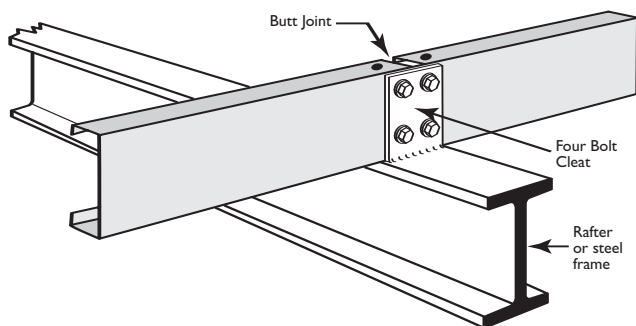

L = span (m)

a = larger distance from support (m)

b = smaller distance from support (m)

w = equivalent uniform load (kN/m)

N = number of point loads over one span (for 6 or more loads)

Design optimisation

The capacity tables provide economical design solutions for most projects. Designs can be optimised by varying:

- Material specifications
- Bolt specifications and number
- Non-standard purlin profile
- Reduced or enlarged end spans
- Span range

- Cantilevers at one or both ends
- Lap length
- Bridging quantity
- Load distribution

Bridging

The capacity tables give solutions for an equal number of rows of bridging in each span. Provision is made for 0, 1, 2 or 3 rows of bridging.

In practice it may be necessary to use at least one row of bridging in each span. We suggest that unbridged lengths be limited to 20 times the section depth.

Cleat connections

The capacity tables are based on the sections being fastened through the web to cleats (cleat connection) so that the load path is via the web of the sections.

The connections may be single section thickness such as in end connections, or the internal support connection of continuous configurations. Connections with double section thickness occur at the internal support of lapped configurations.

Each connection uses two bolts.

Cleatless connections

Fixing of purlins through the bottom flange of the purlin (cleatless connection) is used in some forms of construction. The purlin capacity tables should not be used for these types of connections. For these types of connections there are other design issues (both strength and serviceability) and construction issues that need to be considered.

Contact your local Lysaght Service Centre for more information. The number of bolts used are halved compared with the number used in conventional cleated connections.

Lapping

The structural lap at the interior supports of lapped configurations must be detailed to provide adequate structural continuity.

Each end of the lap must have one bolt through the flange furthest from the cladding, and one bolt through the webs near the flanges connected to the cladding.

The nominal lap length is the distance between the bolt centres at the end of the laps. Laps vary in length with both section size and span as shown in the table below. In no situation must the lap be less than 10% of the span.

Conversion of point loads into equivalent uniform loads

Symmetrical equidistant point loads

| Loading condition | | Conversion formula | |
|-------------------|--------|--------------------|----------------|
| SINGLE LOAD | Simple | | $w = 2P/L$ |
| | Lapped | | $w = 2.22P/L$ |
| 2 LOADS | Simple | | $w = 2.67P/L$ |
| | Lapped | | $w = 3.16P/L$ |
| 3 LOADS | Simple | | $w = 4P/L$ |
| | Lapped | | $w = 3.78P/L$ |
| 4 LOADS | Simple | | $w = 4.80P/L$ |
| | Lapped | | $w = 5.12P/L$ |
| 5 LOADS | Simple | | $w = 6P/L$ |
| | Lapped | | $w = 6.65P/L$ |
| 6 OR MORE LOADS | Simple | | $w = 1.14NP/L$ |
| | Lapped | | $w = 1.22NP/L$ |

Single eccentric and two symmetrical point loads

| Loading condition | | Conversion formula | |
|-----------------------------|--------|--------------------|-------------------------|
| SINGLE ECCENTRIC POINT LOAD | Simple | | $w = 8abP/L^3$ |
| | Lapped | | $w = 17.76ab^2P/L^4$ |
| 2 SYMMETRICAL POINT LOADS | Simple | | $w = 8bP/L^2$ |
| | Lapped | | $w = 9.45b(2L-3b)P/L^3$ |

Intermediate values

Within a given bridging configuration, capacities for intermediate spans may be interpolated linearly.

Notes to capacity tables

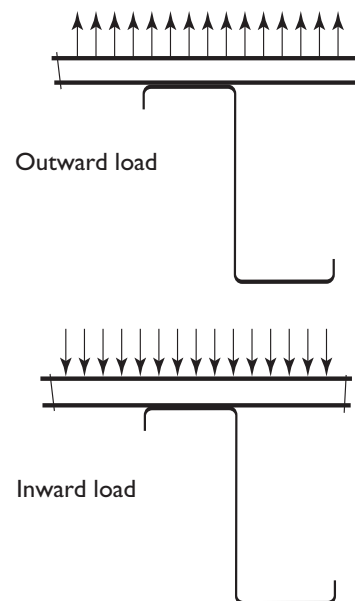

1. Loads are assumed to be uniformly distributed (see also *Point loads*).
2. The capacities assume the use of approved Bluescope Lysaght's sections, bridging system and bolts.
3. The column, Load for deflection span/150, is the load that will produce this deflection. It is not a design capacity.
4. All connections use LYSAGHT purlin bolts grade 4.6, except for boldened capacities which require grade 8.8.
5. Forces acting to hold cladding against a structure are defined as *inward*. Forces acting to remove cladding from a structure are defined as *outward*.

Lap lengths

| Nominal section size (mm) | Span (mm) | Lap length (mm) |
|---------------------------|-----------------|-----------------|
| 100 | ≤ 6000 | 600 |
| | > 6000 | 900 |
| 150, 200, 250 | ≤ 9000 | 900 |
| | > 9000 ≤ 12000 | 1200 |
| | > 12000* | 1800 |
| 300, 350 | ≤ 9000 | 900 |
| | > 9000 ≤ 12000 | 1200 |
| | > 12000 ≤ 18000 | 1800 |
| | > 18000* | 2400 |

* Load capacities for these spans are beyond the scope of this publication

Bold capacities require grade 8.8 purlin bolts.
IN = Inward load capacity.

Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
 IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts.
IN = Inward load capacity.

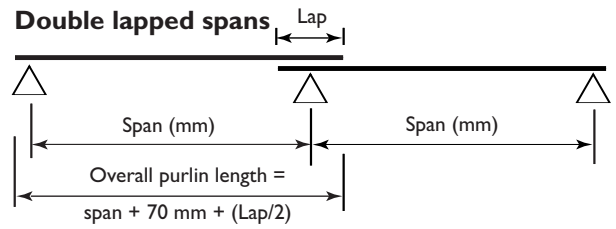

Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
OUT = Outward load capacity. See also: Design notes for capacity tables.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables. In mixed spans, the thicker section is used in the end spans.

TL100

Limit state capacity tables

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables. In mixed spans, the thicker section is used in the end spans.

TL300.1

Limit state capacity tables

Three lapped spans

Three lapped spans

Three lapped span: Z30030 (kN/m)

Three lapped span: Z35030 (kN/m)

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables. In mixed spans, the thicker section is used in the end spans.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.

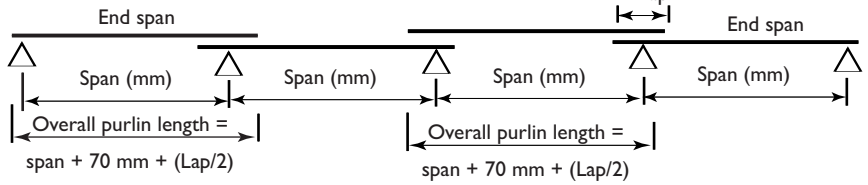

IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables. In mixed spans, the thicker section is used in the end spans.

Bold capacities require grade 8.8 purlin bolts. Values above horizontal line in body of table are governed by the strength of the grade 8.8 bolt.
IN = Inward load capacity. OUT = Outward load capacity. See also: Design notes for capacity tables.

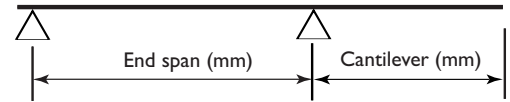

FL300.2/350

Limit state capacity tables

Cantilever spans

1. The capacities are for cantilevers with single end span. The ends of the cantilevers are stabilised by fascias, bridging, barge boards, perimeter beams or similar structural members.
2. Bold capacities require grade 8.8 purlin bolts.
3. Bridging shown is for end spans only.
4. See also *Design notes for capacity tables*
